

REVISTING: THERMAL ENERGY & PHASE CHANGES IN H₂O

Energy stored as **LATENT ENERGY**

(energy is “hidden” & not sensed)

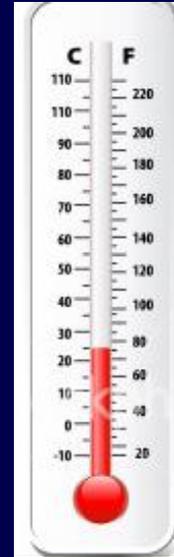

← Energy released as **SENSIBLE HEAT**

(i.e. the warmth can be “sensed”)

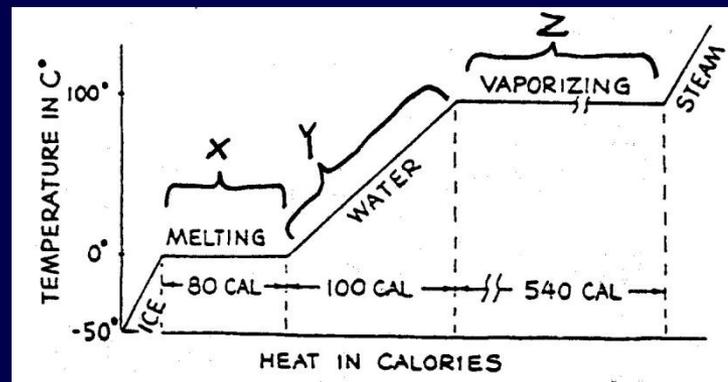

Now back to p 47

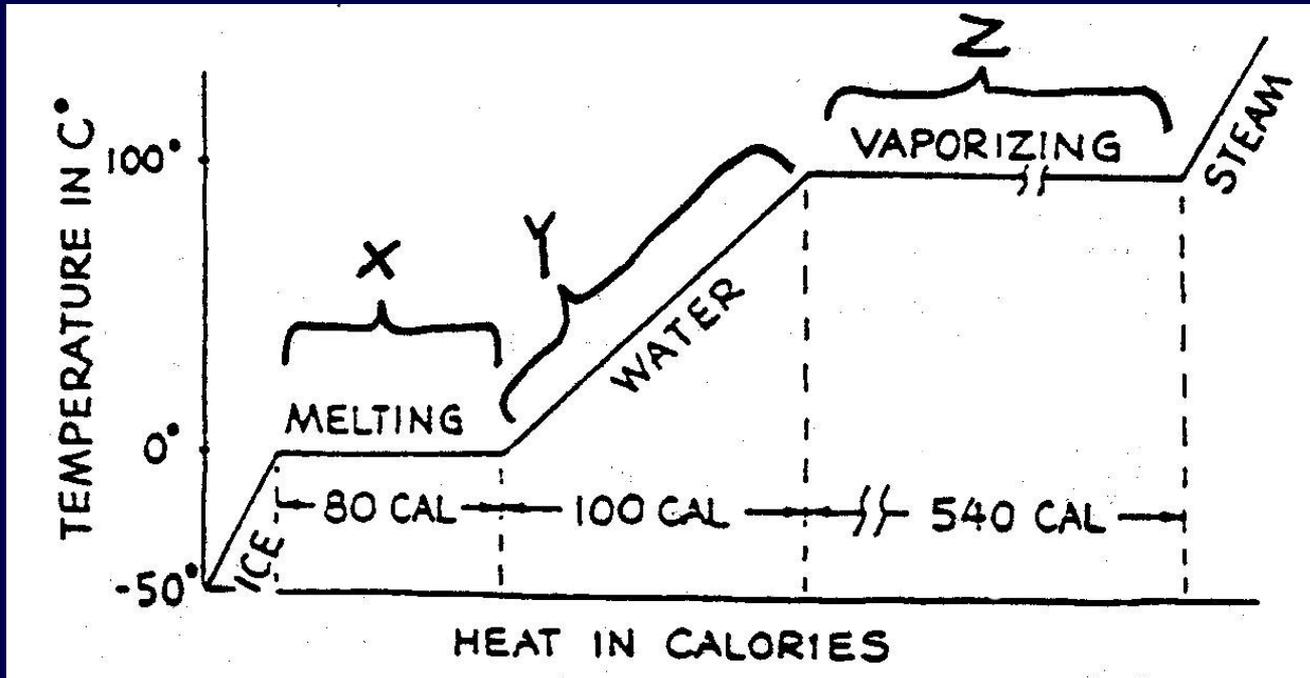

REVIEW / BACKGROUND:

SENSIBLE = the energy can be **SENSED**
(e.g., with a thermometer,
by the environment, etc.)

LATENT (means “HIDDEN”) = the
energy is there, but it is **NOT**
SENSED by the environment,
a thermometer . . . or YOU!

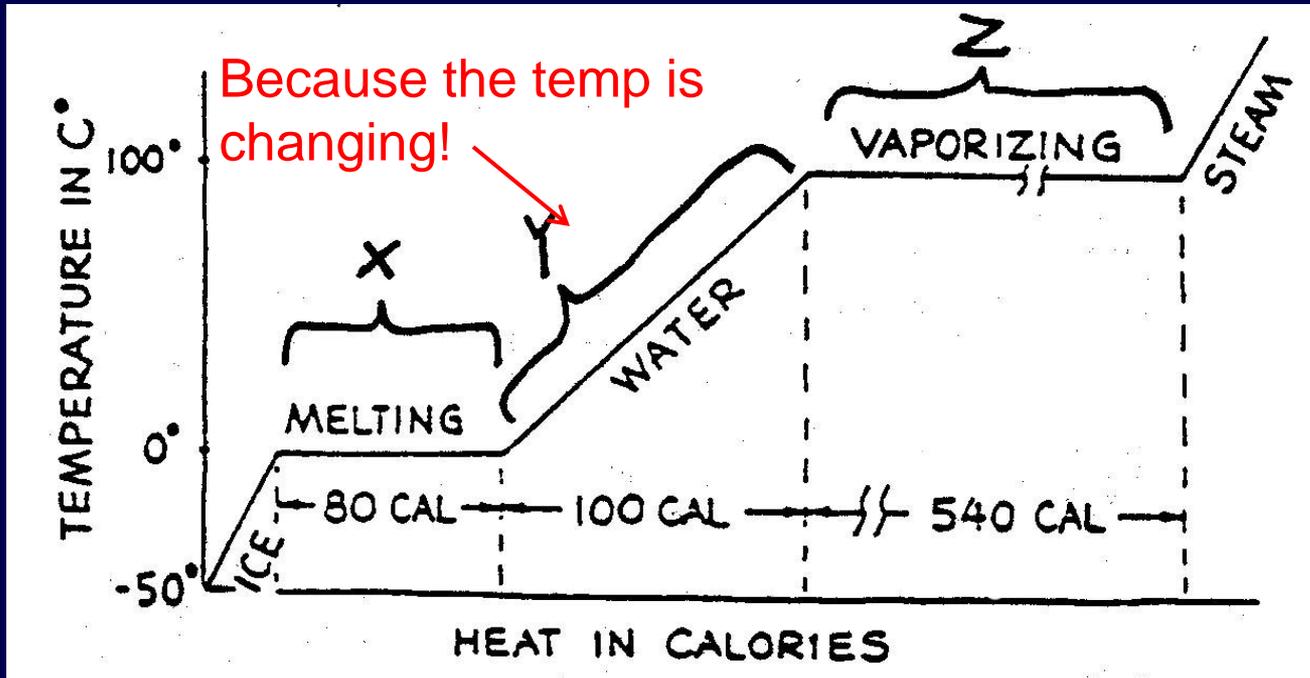

Q1 -- Which segment or segments of the graph represent(s) **SENSIBLE HEAT (H)** ?

1 = X & Z

3 = Y only

2 = X only

4 = Z only

Q1 -- Which segment or segments of the graph represent(s) **SENSIBLE HEAT (H)** ?

1 = X & Z

3 = Y only

2 = X only

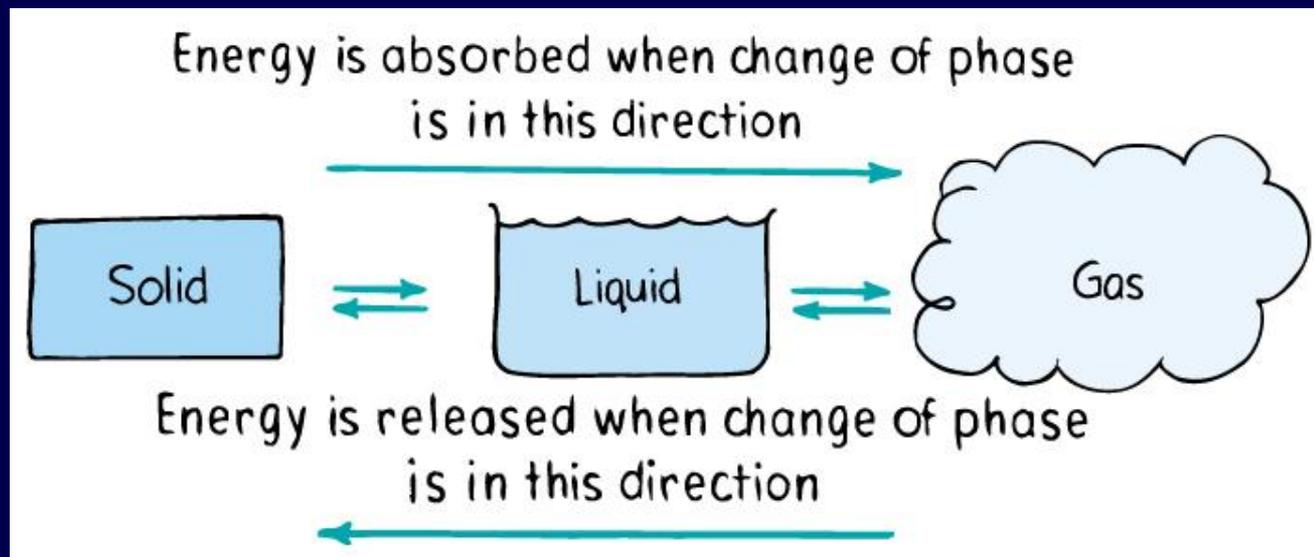

4 = Z only

Q2- In a phase change from **ice to water** or **water to water vapor**, **WHAT** is absorbing the energy?

1 = the surrounding environment

2 = the H₂O molecules

3 = both the environment & the H₂O

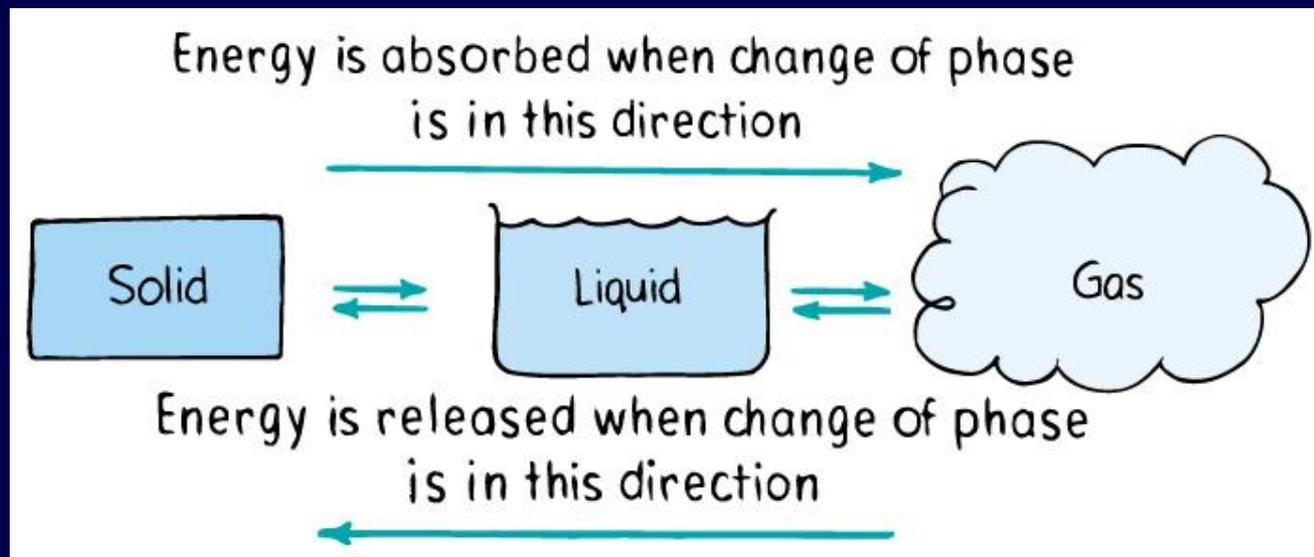

Q2 - In a phase change from **ice to water** or **water to water vapor**, WHAT is absorbing the energy?

1 = the surrounding environment

2 = the H₂O molecules

3 = both the environment & the H₂O

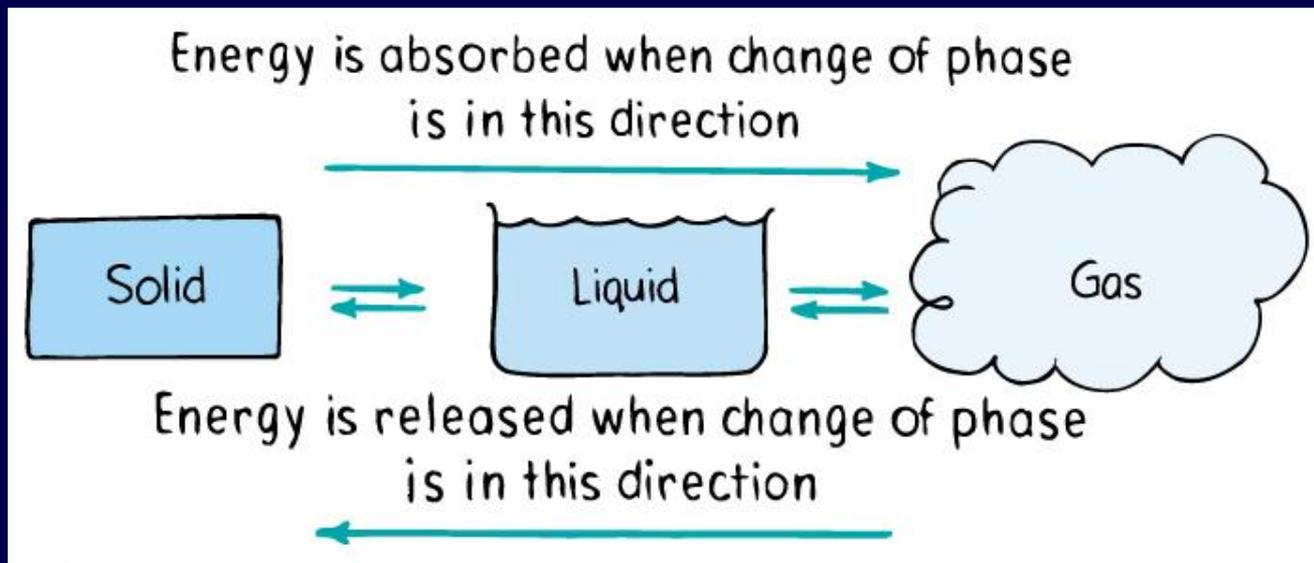

Q3 - In a phase change from **water vapor to liquid water** or **liquid water to ice**, TO WHERE is the energy being released?

1 = into the surrounding environment

2 = into the H₂O molecules

3 = into both the environment & the H₂O

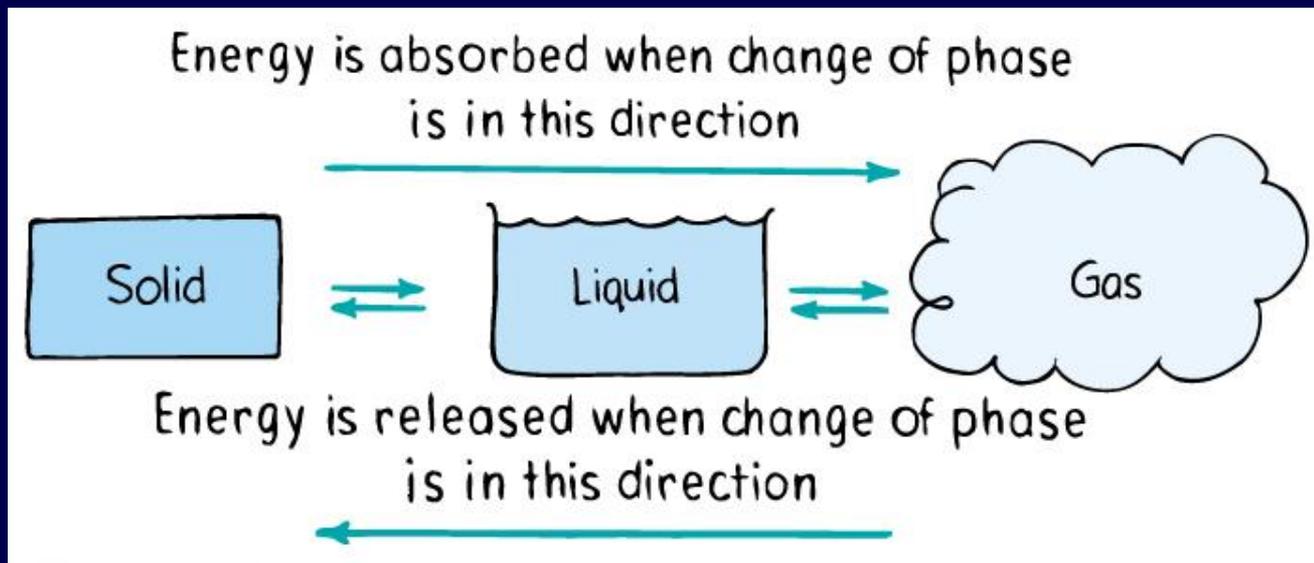

Q3 - In a phase change from **water vapor to liquid water** or **liquid water to ice**, TO WHERE is the energy being released?

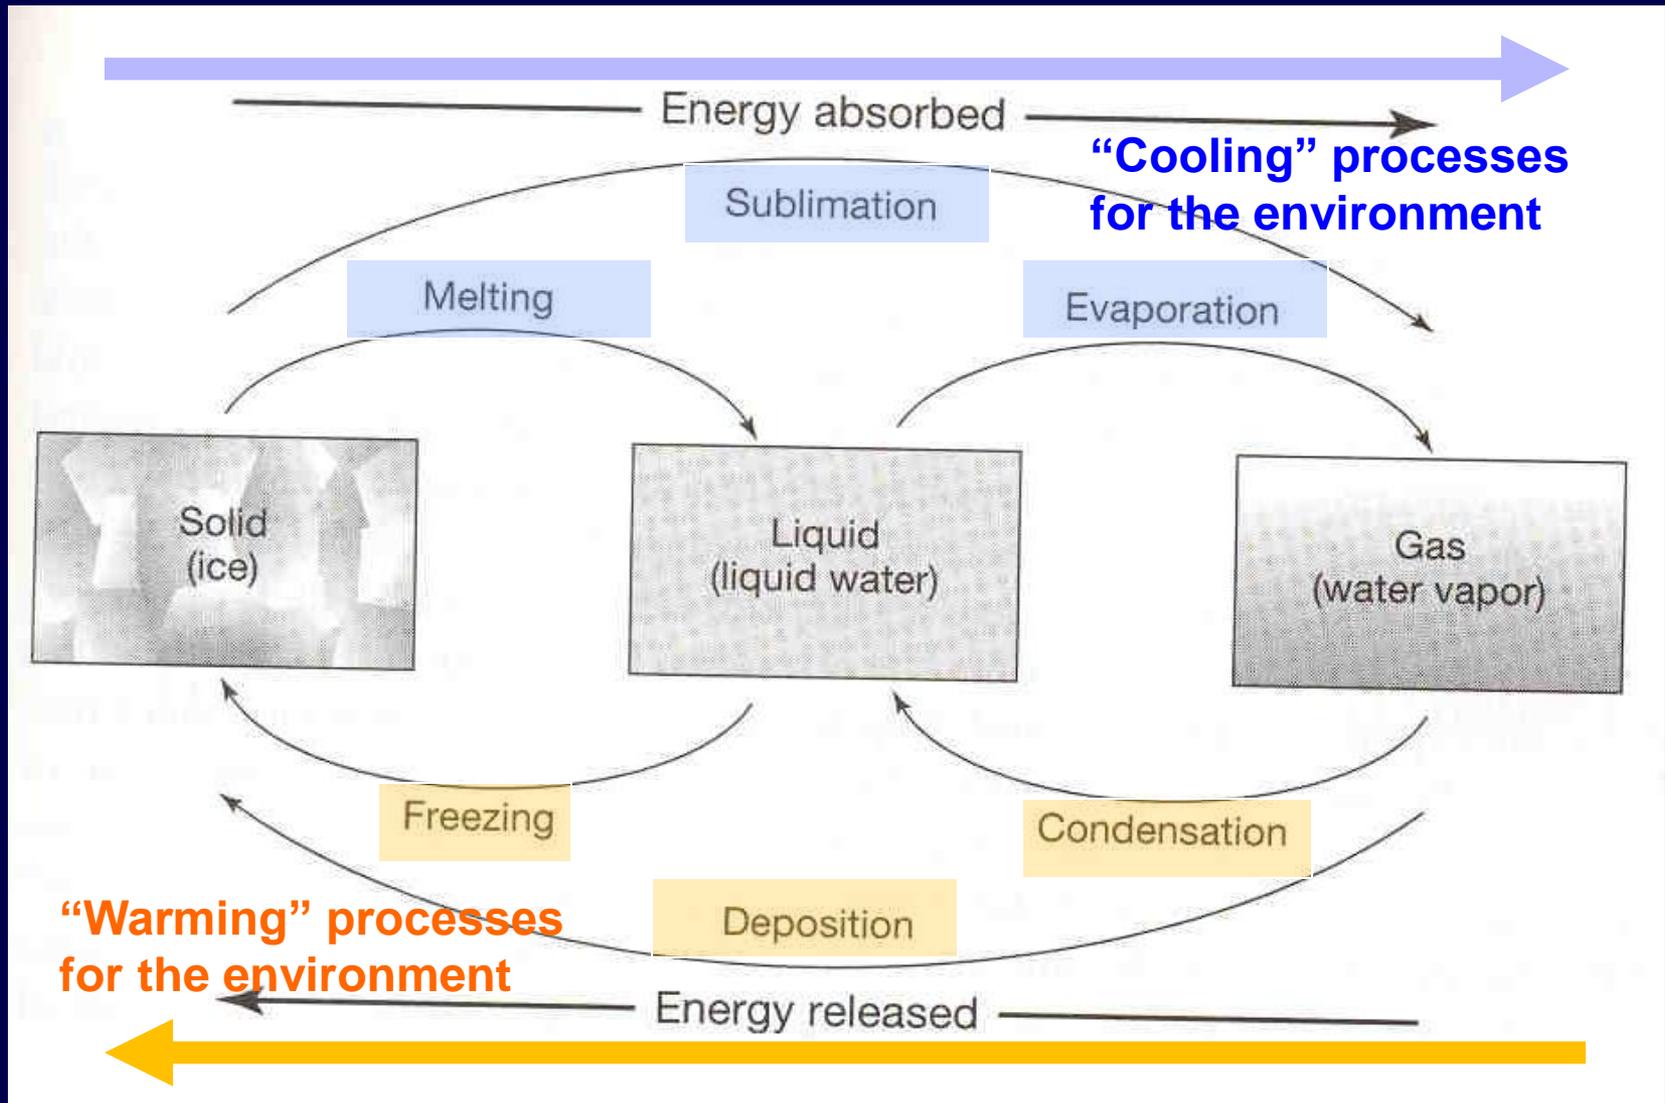

1 = into the surrounding environment

2 = into the H₂O molecules

3 = into both the environment & the H₂O

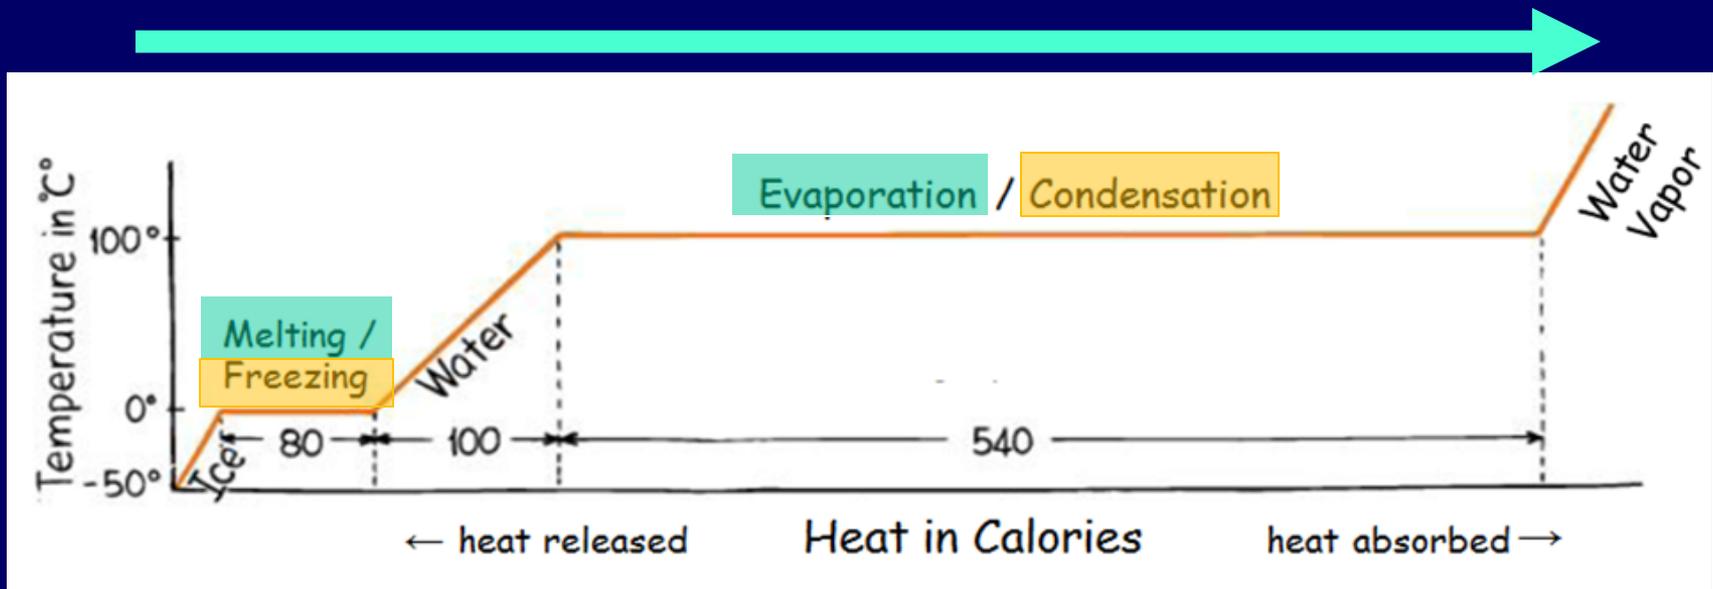

PHASE CHANGES (another view)

This is in your textbook: Fig 4-23 p 77 in SGC E-text

ANNOTATED VERSION OF FIGURE (from Test #2)

During **MELTING & EVAPORATION**, thermal energy (that is **SENSED**) flows into the H₂O molecules where it is **ABSORBED** (when that happens, it becomes “hidden” **LATENT ENERGY**)

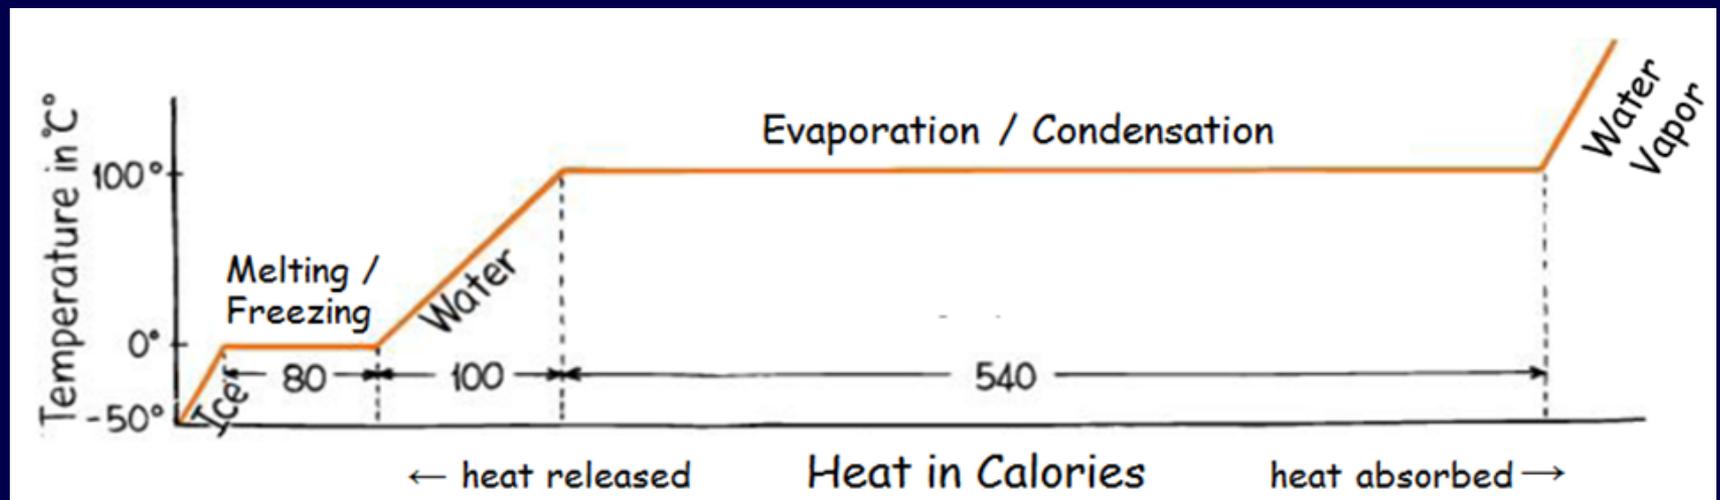

During **CONDENSATION & FREEZING**, thermal energy (that is **LATENT**) is **RELEASED** by the H₂O molecules & flows into the surrounding environment (when that happens, it becomes **SENSIBLE HEAT**)

Q4- The figure below illustrates temperature change when one gram of H₂O goes through various **phase changes**.

Which of the processes labeled on the figure involves the **flow of energy** from **sensible heat** to **latent energy**?

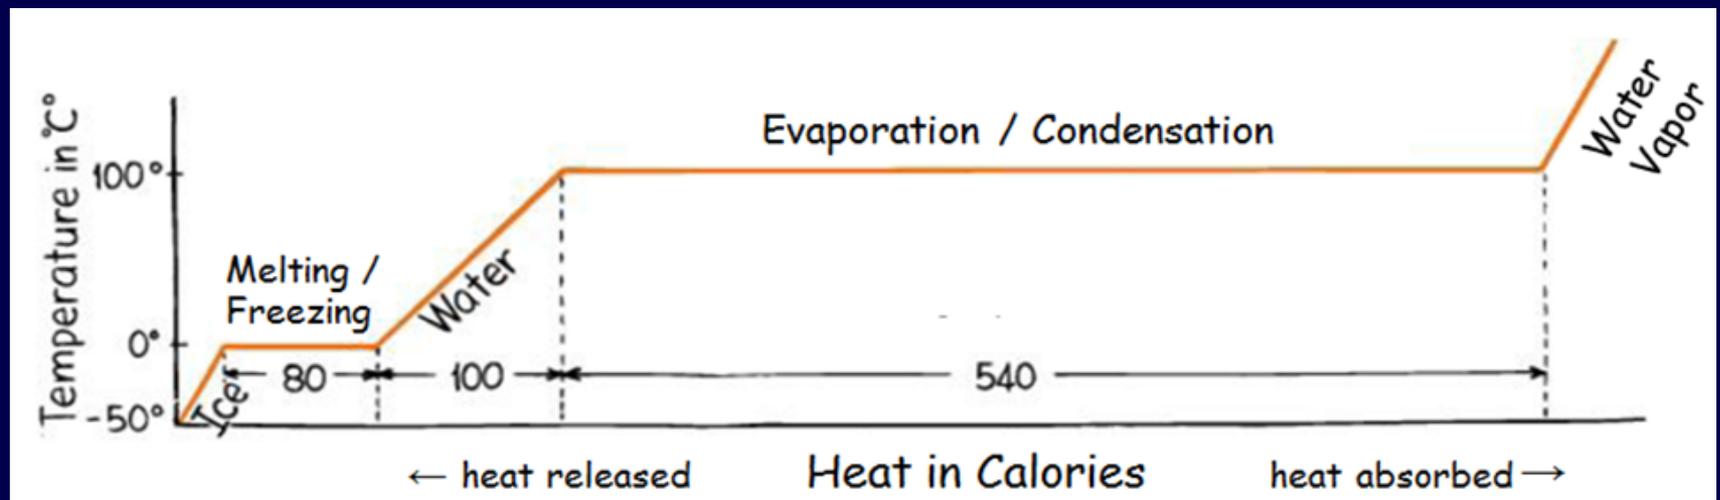

1 - Freezing 2 – Evaporation 3 - Condensation

Q4- The figure below illustrates temperature change when one gram of H₂O goes through various **phase changes**.

Which of the processes labeled on the figure involves the **flow of energy** from **sensible heat** to **latent energy**?

1 - Freezing **2 – Evaporation** 3 - Condensation

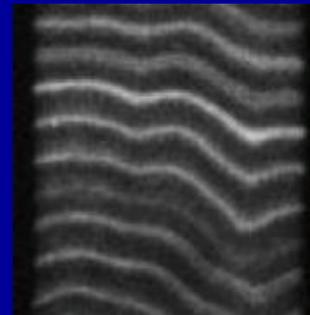

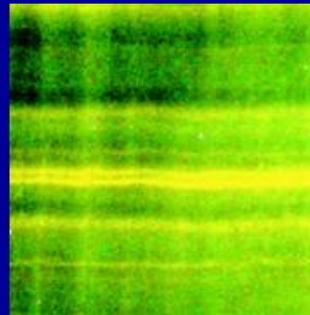

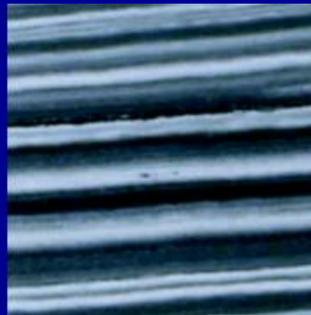

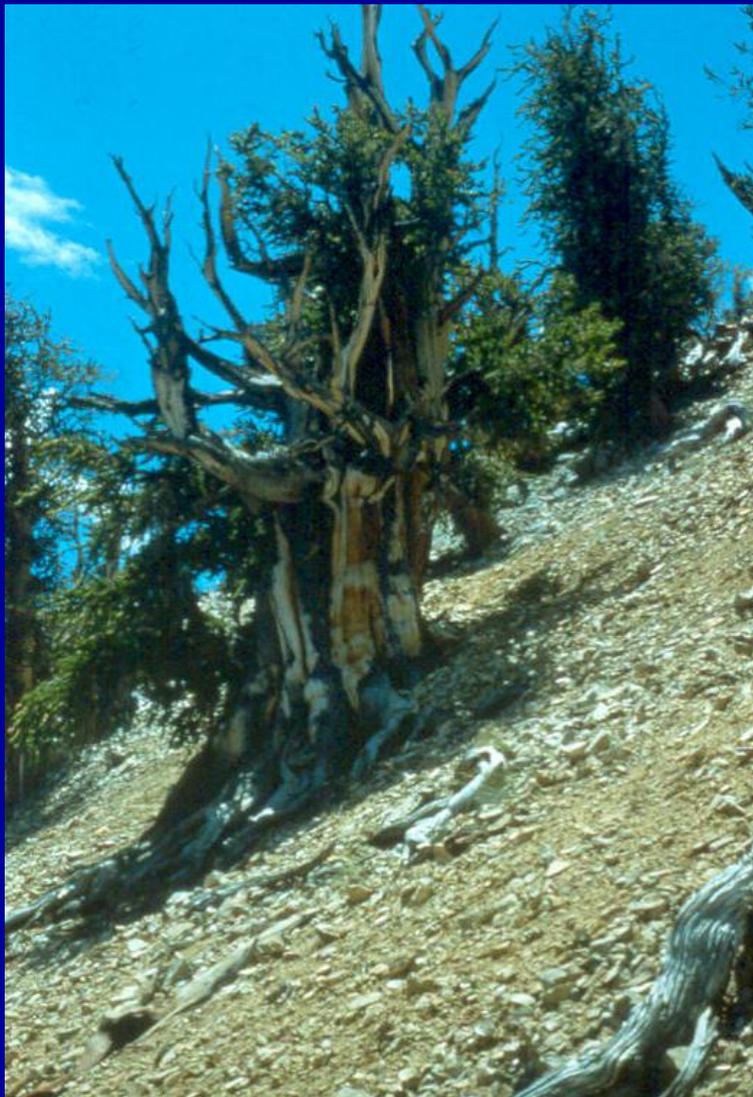

TODAY'S TOPIC:

“NATURAL ARCHIVES”

as

Global Change Tools

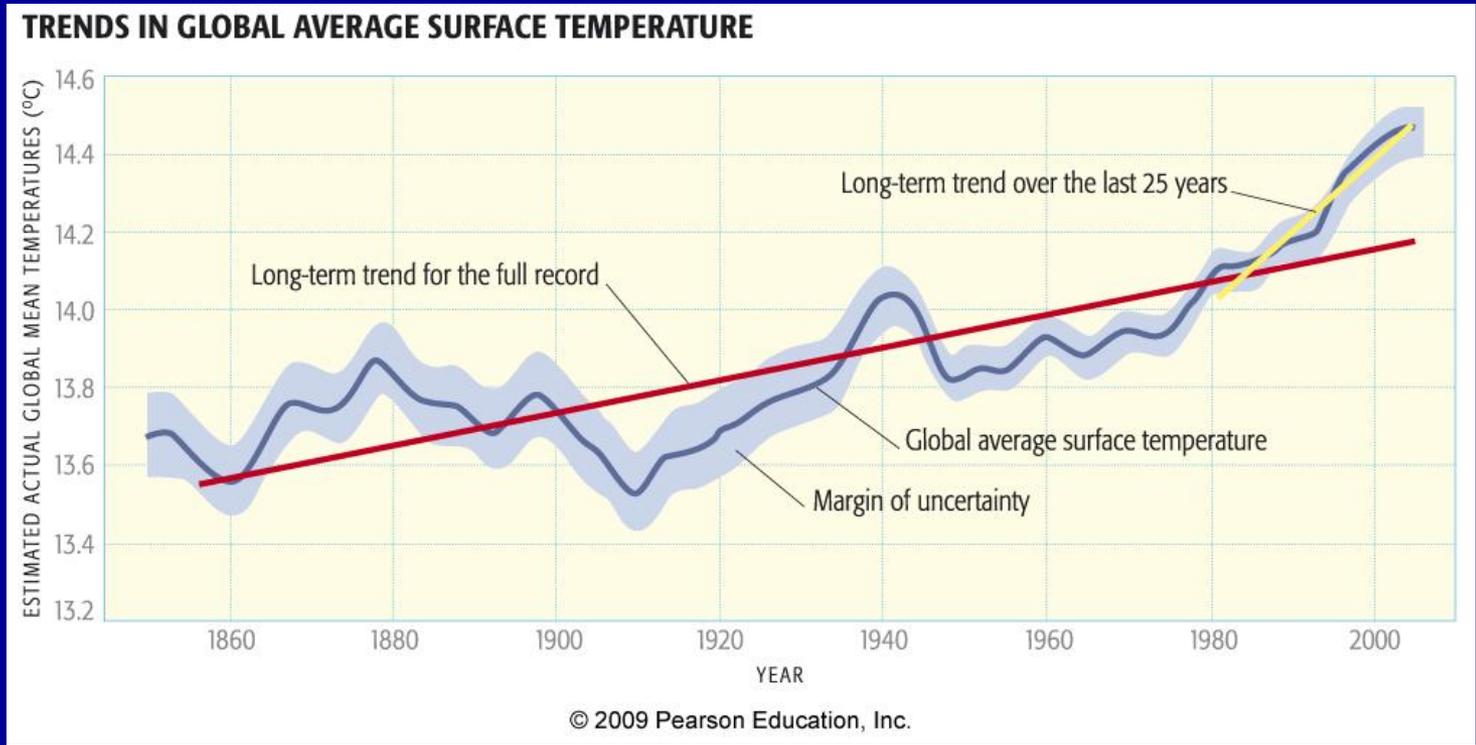

*Trees and stones
will teach you that
which you can
never learn from
masters.*

~ St. Bernard of Clairvaux

DETECTING GLOBAL WARMING:

In the recent past, we use the “**INSTRUMENTAL RECORD**” based on actual Thermometer readings from around the globe

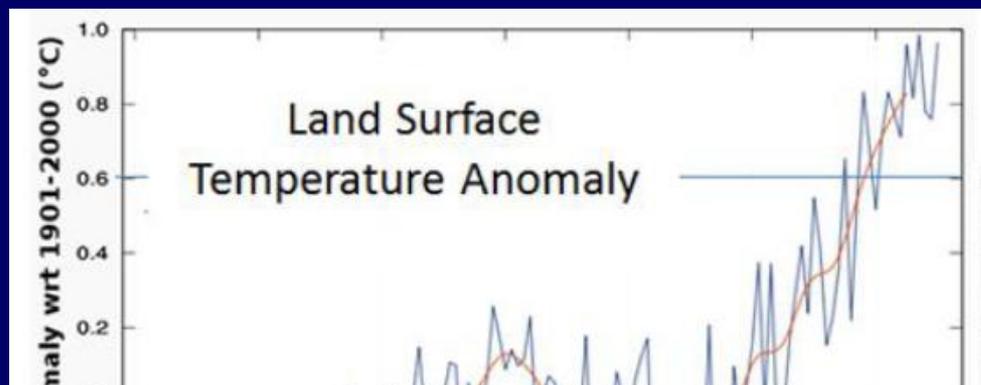

Temperature Trends →

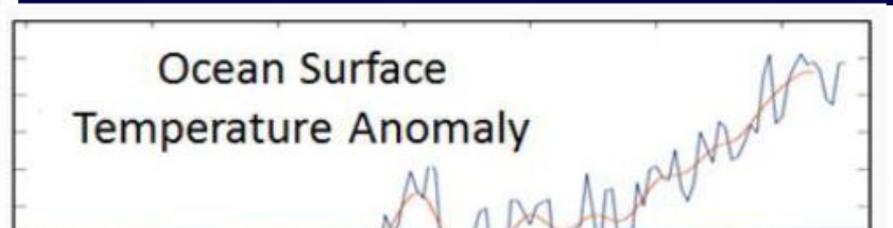

From Dire Predictions, p 36

We looked at some of these during this Indicator Interlude . . . Remember these time series “anomaly” plots?

INDICATOR INTERLUDE . . .

But what about what happened long before 1880 or before the Industrial Revolution?

Don't we really need to look at temperatures from a LONG time ago to assess the severity of the recent temperature observations of warming?

To make an incontrovertible case about the role that humans play in global warming, what do scientists need?

- 1) a long-term temperature record, i.e., centuries
- 2) over a large part of the globe
- 3) To be able to say

“What's the average been for several hundred years, & is this a significant departure from that?”

“And that's very difficult to do.”

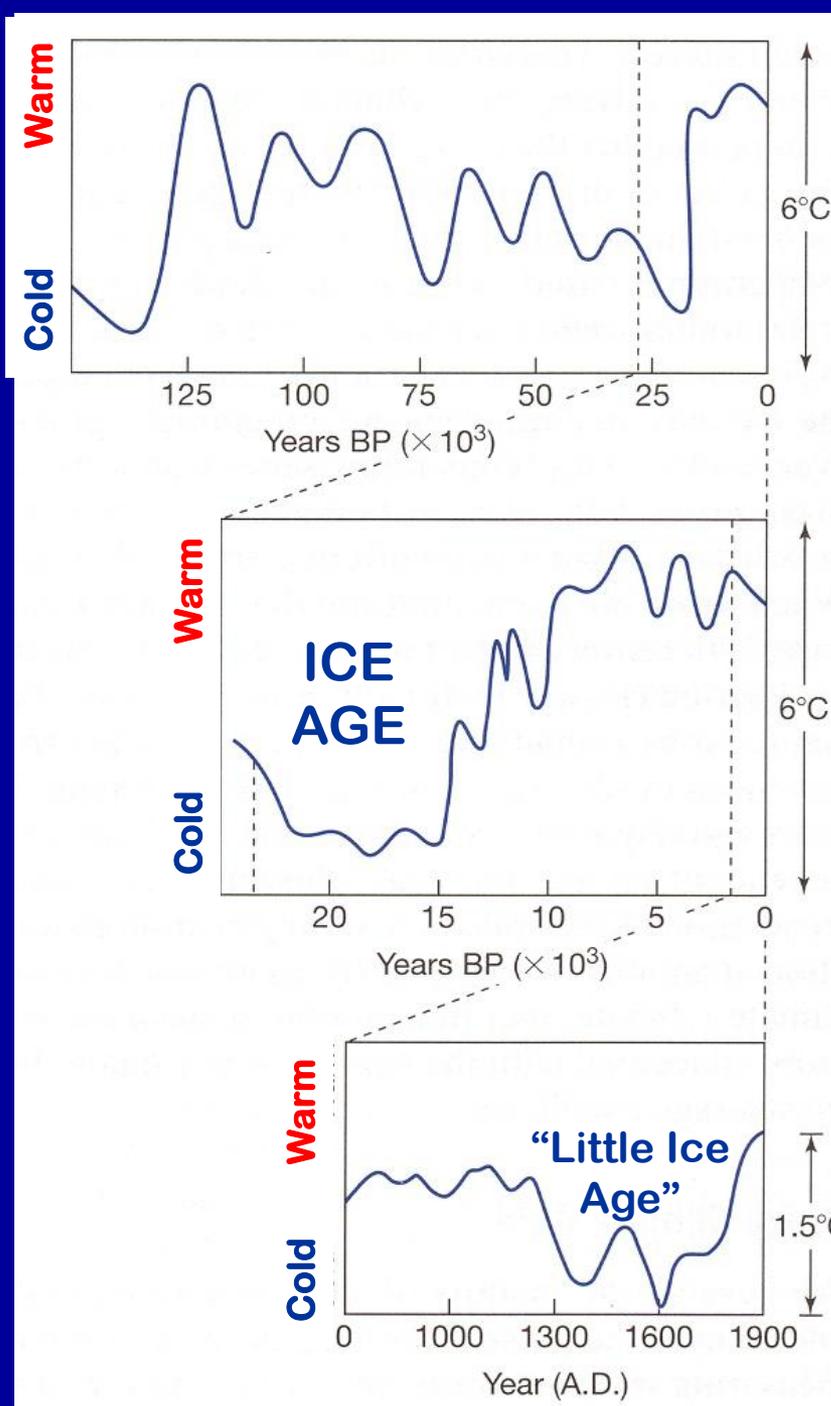

(James Trefil, physicist)

“NATURAL ARCHIVES” CAN GIVE US INSIGHTS INTO THE PAST

. . . over different “Telescoping” Time Scales Of Variability about:

Global Temperature Change

Since The Last Glacial Maximum
(Years BP = “years before present”)

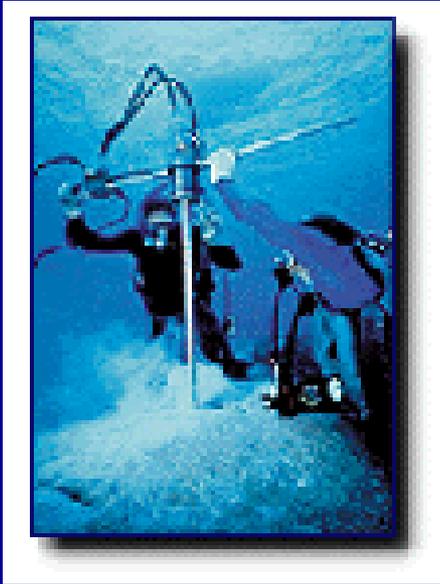

Generalized oxygen isotope curve from **deep-sea sediments**

Generalized estimates from **pollen data & alpine glaciers** (mid-latitudes of eastern N. America & Europe)

General estimates from **historical documents** (emphasis on the North Atlantic region)

NATURAL ARCHIVES of CLIMATE

(sometimes called "PROXY" DATA)

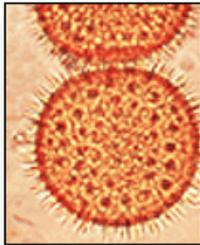

Corals

Ice cores

**Lake, bog &
ocean
sediments**

Pollen

Tree rings!

ANNUAL RECORDS OF THE PAST

INTRODUCTION TO TREE RINGS & DENDROCHRONOLOGY Part I

CLASS NOTES
Appendix: p 117

Dendrochronology is the dating and study of annual rings in trees:

- *chronos*: time, or more specifically events in past time
- *dendros*: from trees, or more specifically the growth rings of trees
- *ology*: the study of . . .

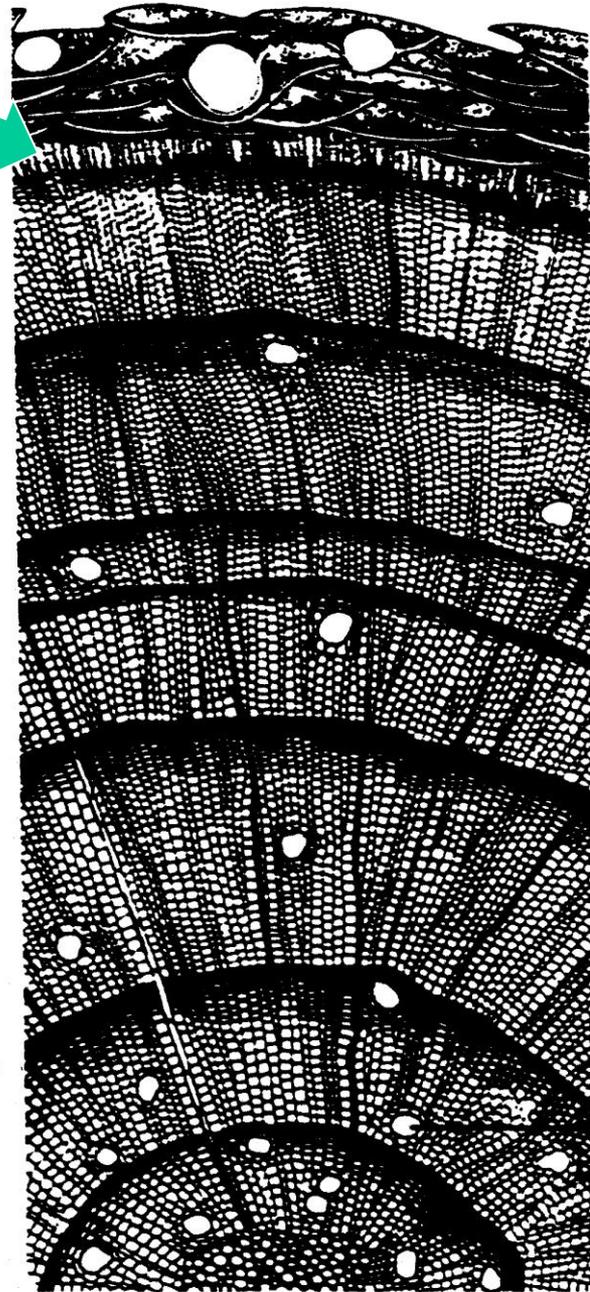

The current year's actively growing cells are just underneath the bark

Partial cross-section of a coniferous tree

How old is it?
(in complete years) count 'em!

7 years old
(now in 8th year of growth)

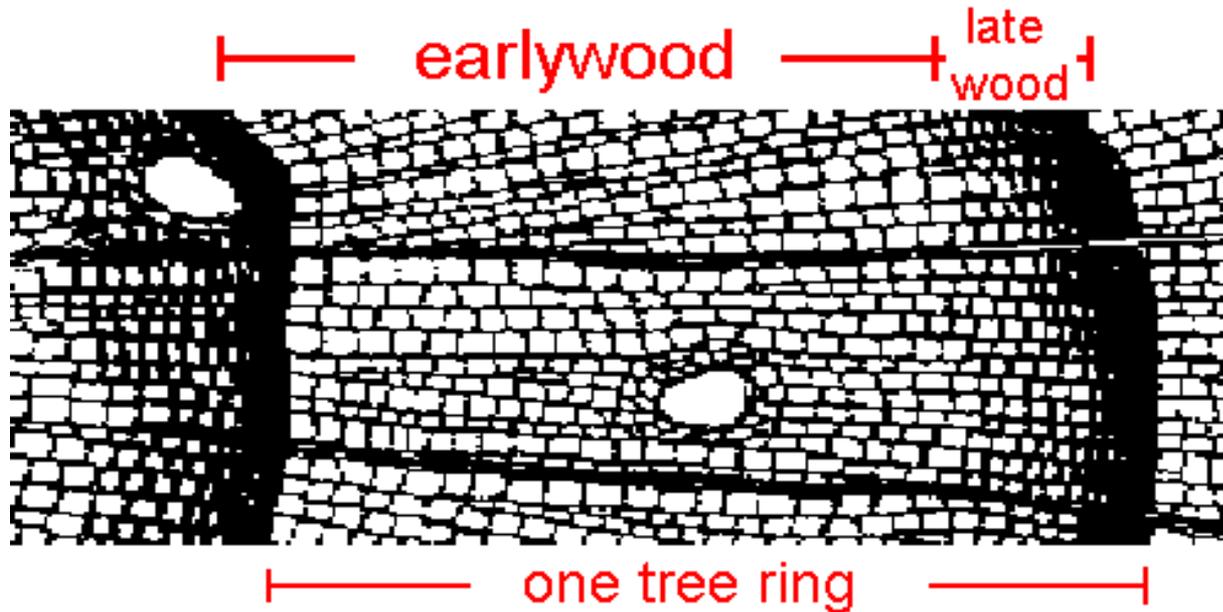

Bark
— Cambium
— False ring
} Annual ring
} Latewood
} Earlywood
— Resin duct

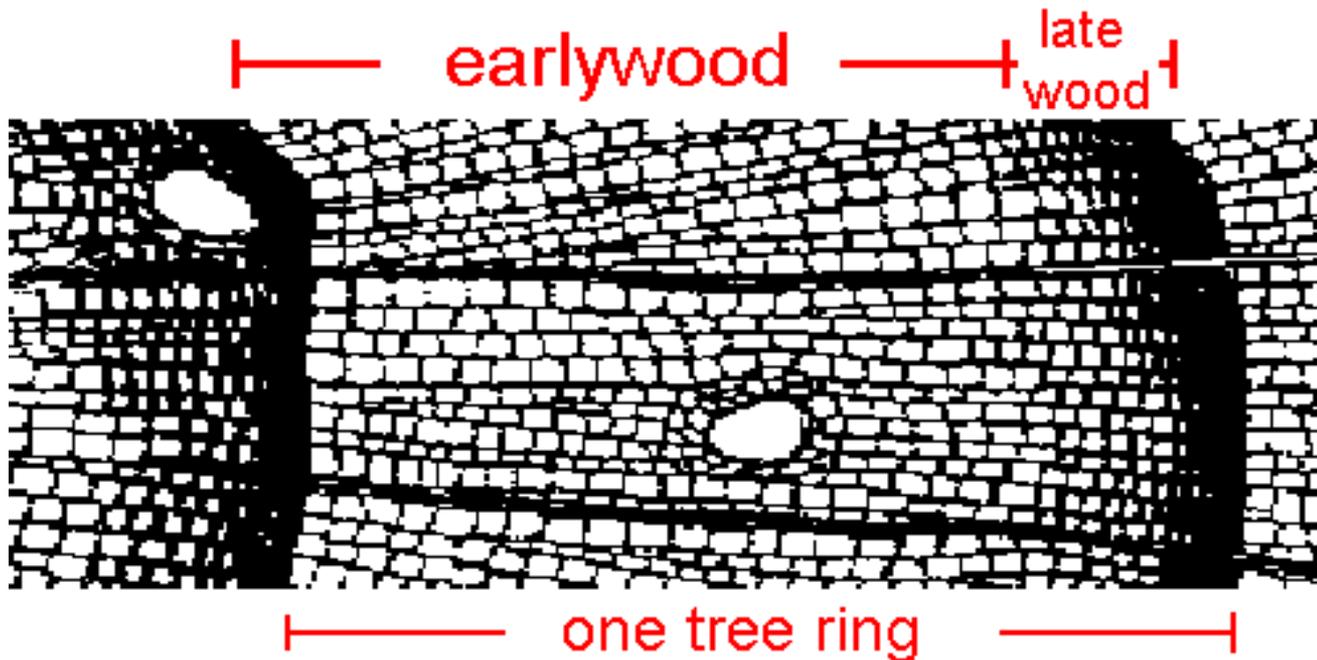

Pith

Why we can see the rings: cell size & thickness changes during the growing season

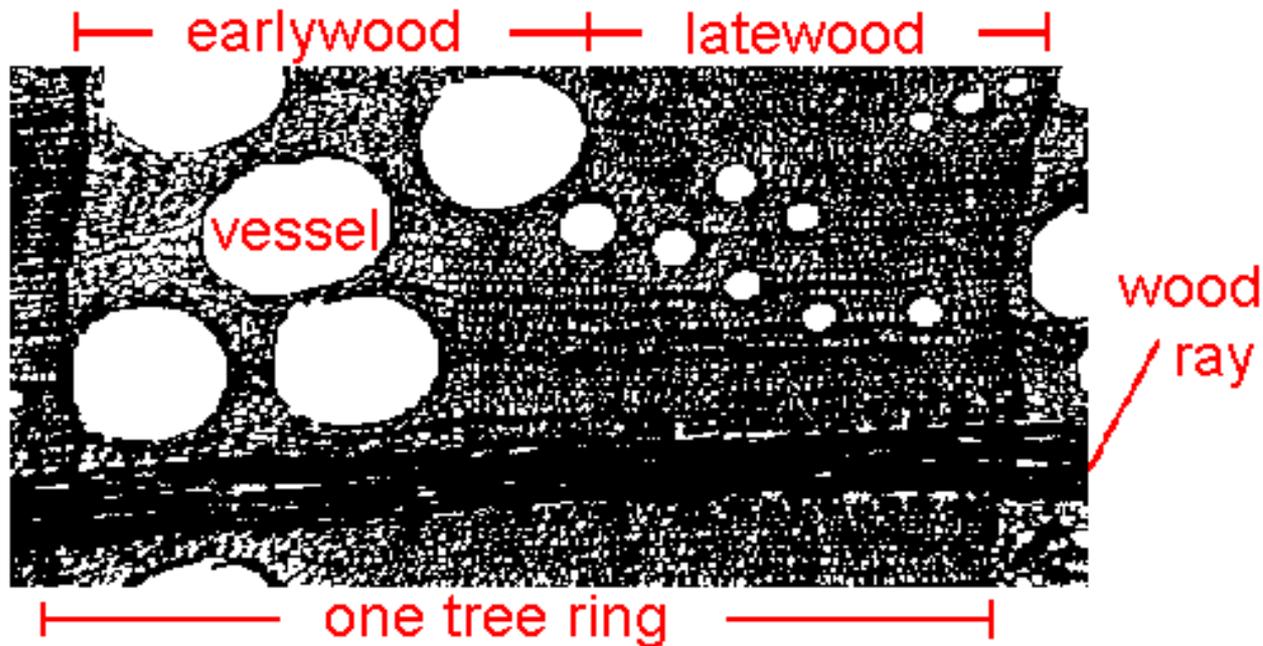

Conifer Tree Ring (cross-section view)

- Earlywood:
 - Cells: thin walls, large diameter
 - Appears light in color
- Latewood:
 - Cells: thick walls, small diameter
 - Appears dark in color

Ring Porous Angiosperm Tree Ring (cross-section, view)

- Earlywood:
 - Cells: large diameter vessels
- Latewood:
 - Cells: small diameter vessels

**But
not all
trees
have
rings!**

The image below shows a conifer tree-ring sample with about thirty rings (every tenth ring is marked)

The rings display much variation:

Tree growth (adding new cells) is this way

← Pith
(center of tree)

Oldest part of tree

Bark →
(outer rings of tree)

Newest growth of tree

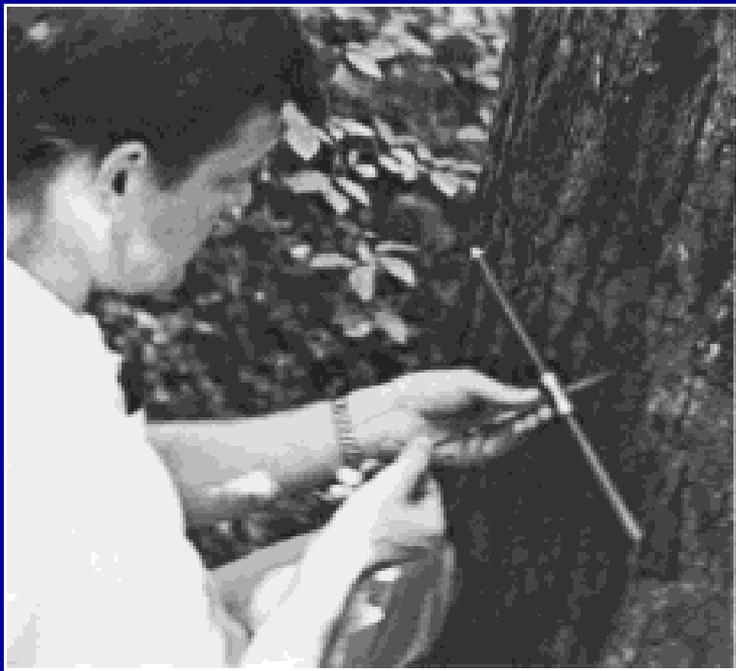

Variation in these rings is due to variation in environmental conditions when they were formed.

(cold or warm temperatures / dry or moist soil conditions, etc. – even insect outbreaks and non-climatic factors, too)

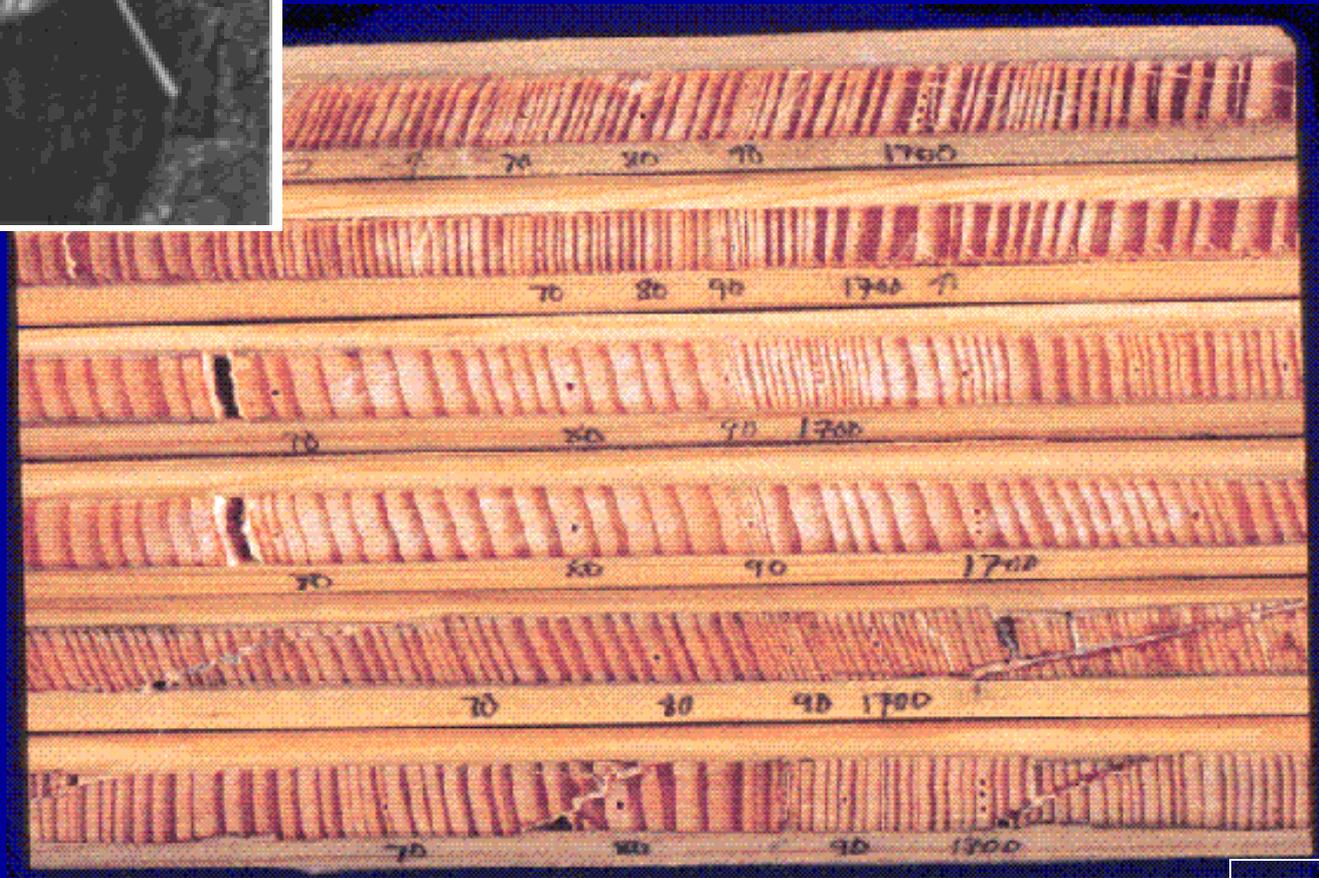

Thus, studying this variation leads to improved understanding of past environmental conditions and is the basis for many research applications of dendrochronology.

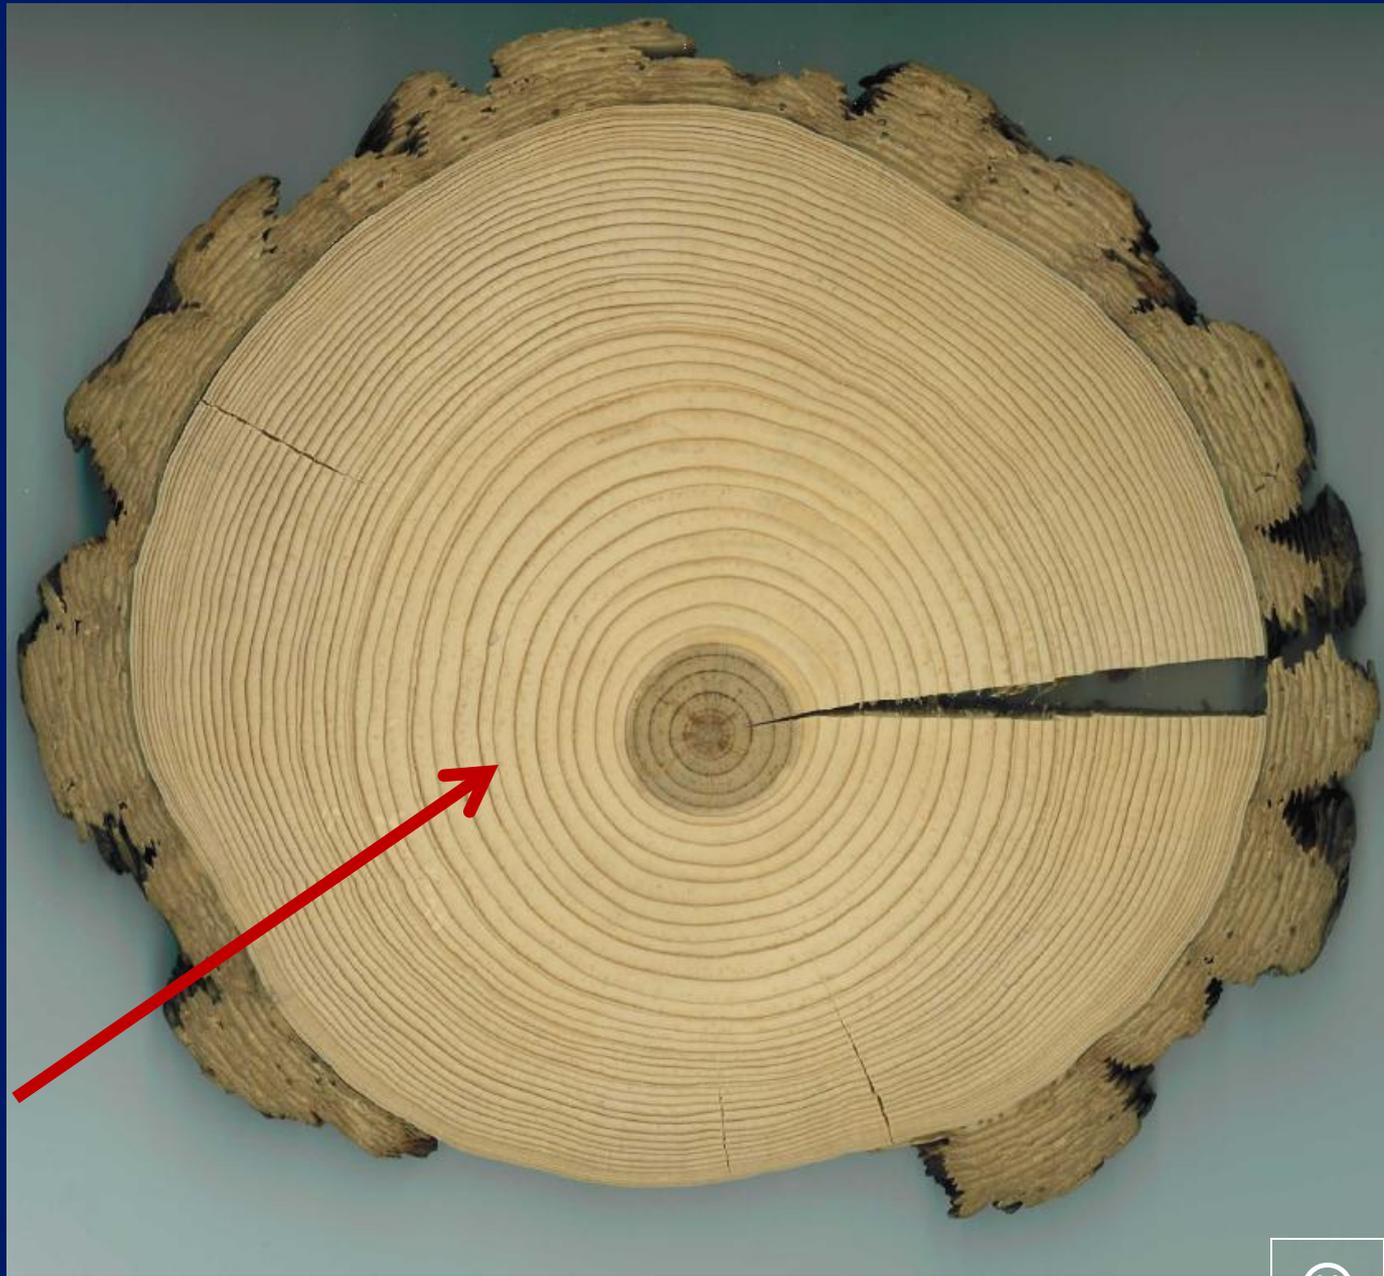

How do we get the tree rings without killing the trees!

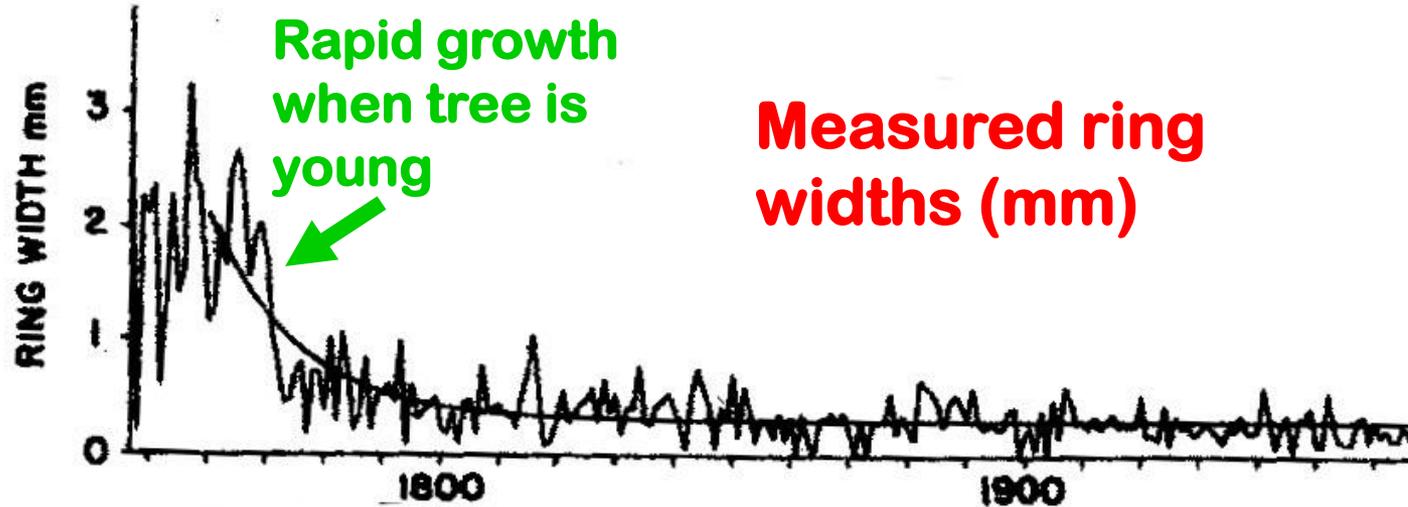

Cores are extracted with an increment borer

If the tree is already dead or cut down, we can take cross-sections from the tree or its stump →

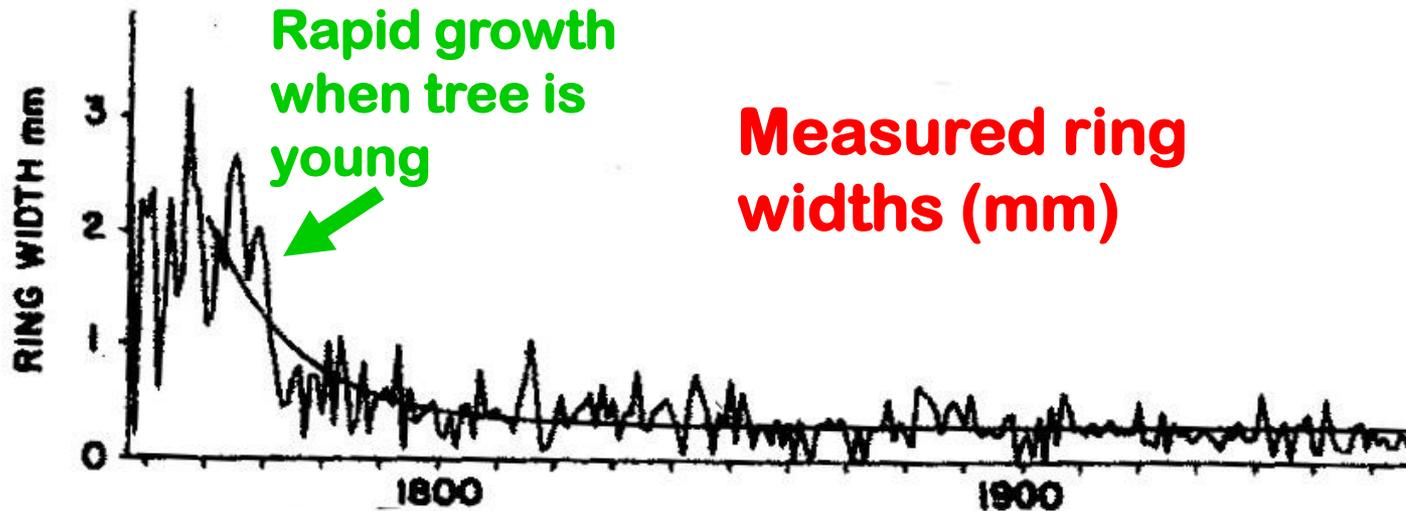

Notice how wide the rings in the center are – this was when the tree was young and growing faster!

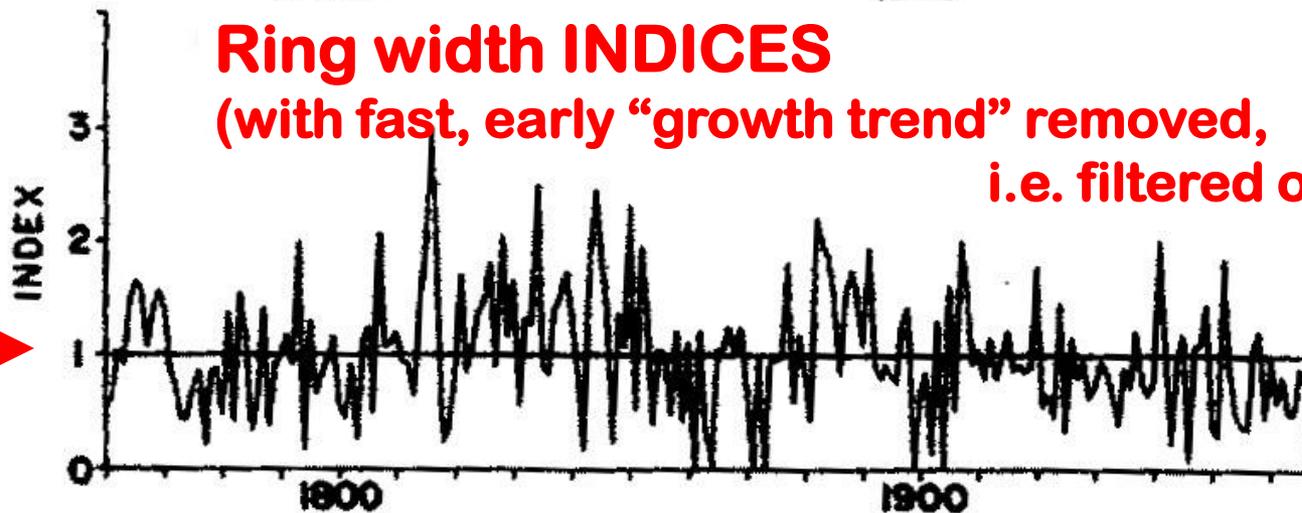

TREE-RING WIDTH CHRONOLOGY

A time series plot!

Ring width INDICES
 (with fast, early "growth trend" removed,
 i.e. filtered out)

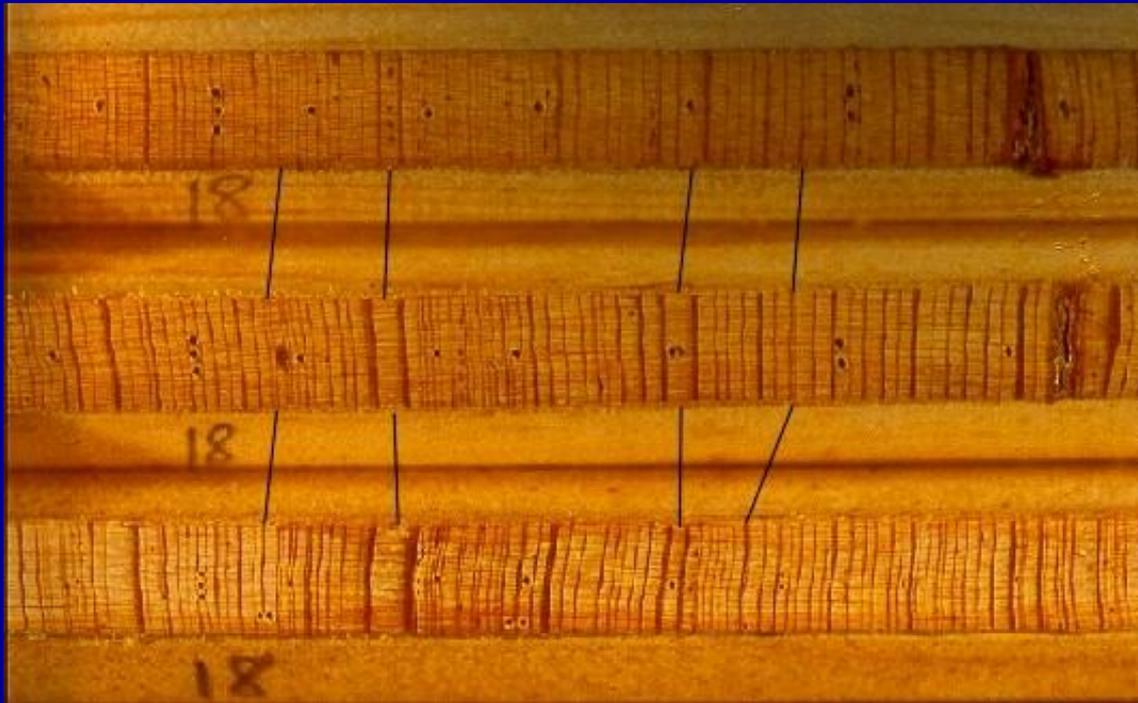

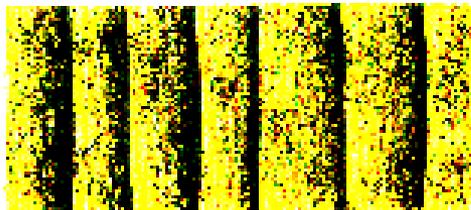

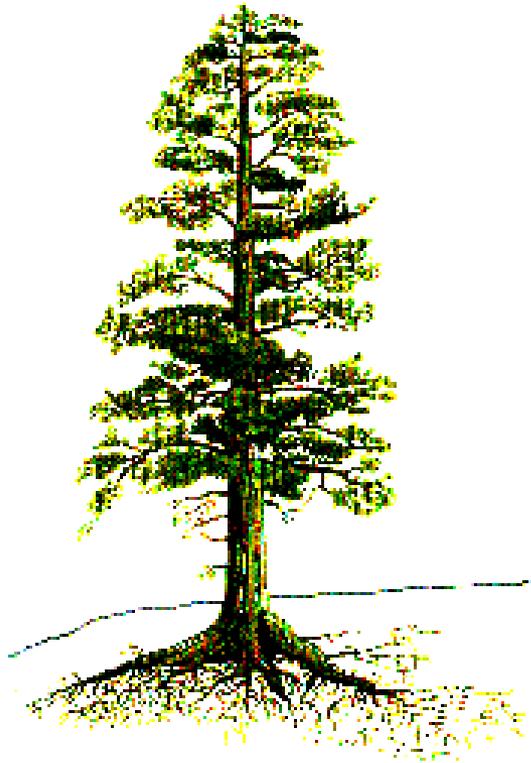

index of
1 = mean

TREE-RING WIDTH CHRONOLOGY

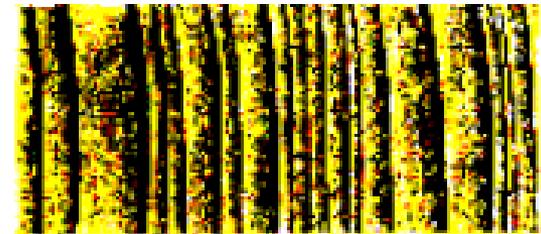

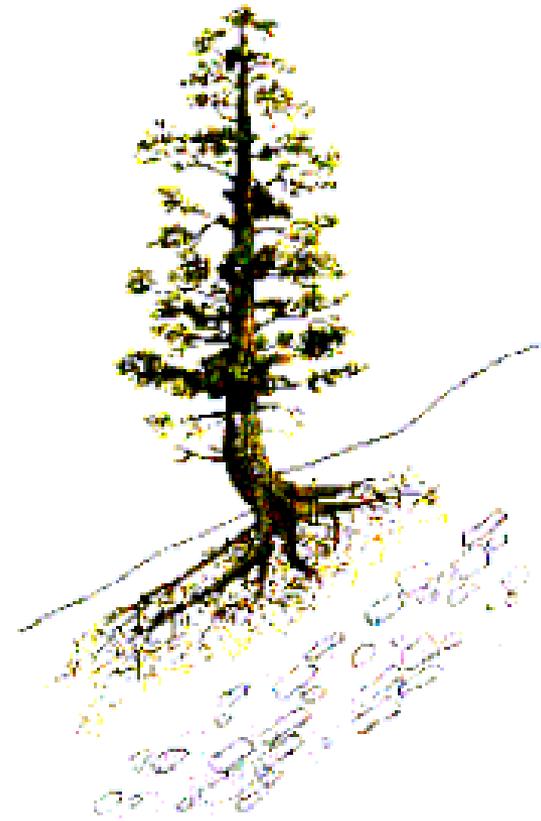

“CROSSDATING” = matching patterns in rings of several tree-ring series to allow precise dating to exact year.

Can be done most easily with a **SENSITIVE tree ring width series** with lots of variation in wide and narrow rings (esp. the **NARROW** ones)!

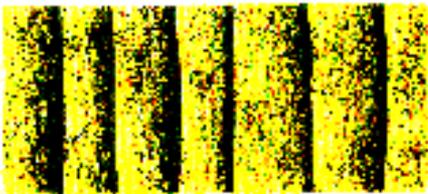

Complacent

Sensitive

"COMPLACENT" TREE GROWTH:

- **Little ring width variation** & rings roughly same width
- **Growth not limited** in certain years
- Favorable growing sites; moisture probably available: (deep soil, close to water)
- **Difficult to crossdate:**
matching patterns is harder when not much variation exists !

"SENSITIVE" TREE GROWTH:

- **Lots of ring width variation** w/ wide and narrow rings intermixed over time

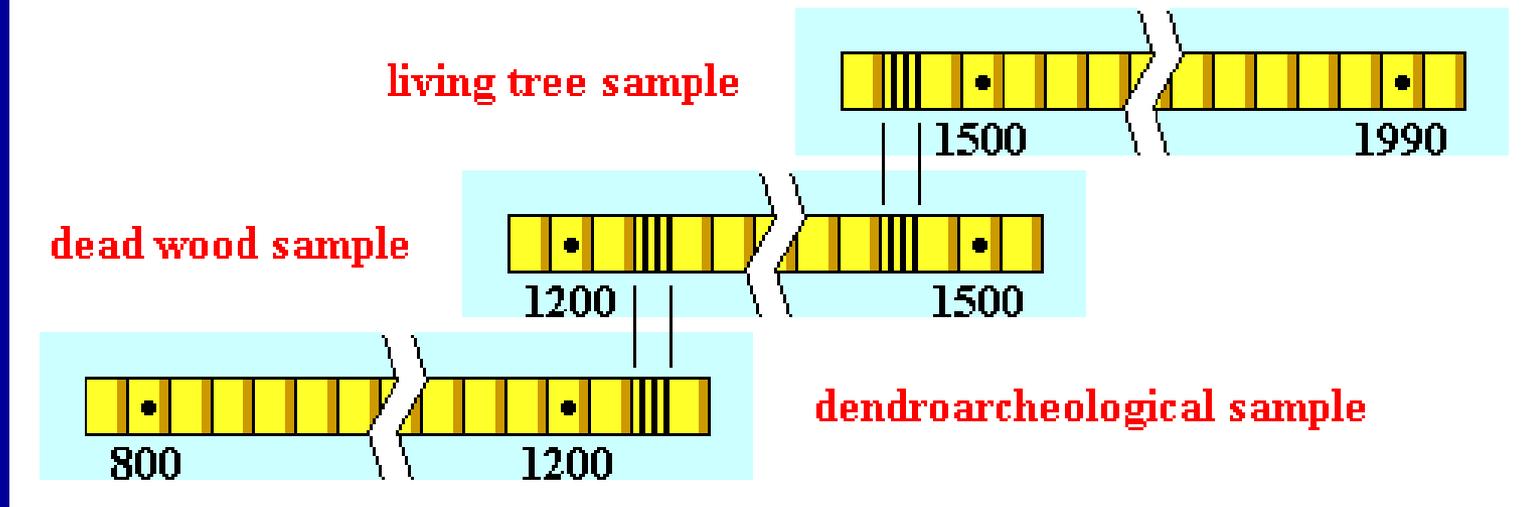

- **Factors which could limit growth** in a particular year (e.g., rainfall) are highly variable year to year

- Especially true for harsh sites (e.g., steep/rocky)

- **Easier to crossdate:**

- Can match patterns of wide and narrow rings from tree to tree when ample variation exists**

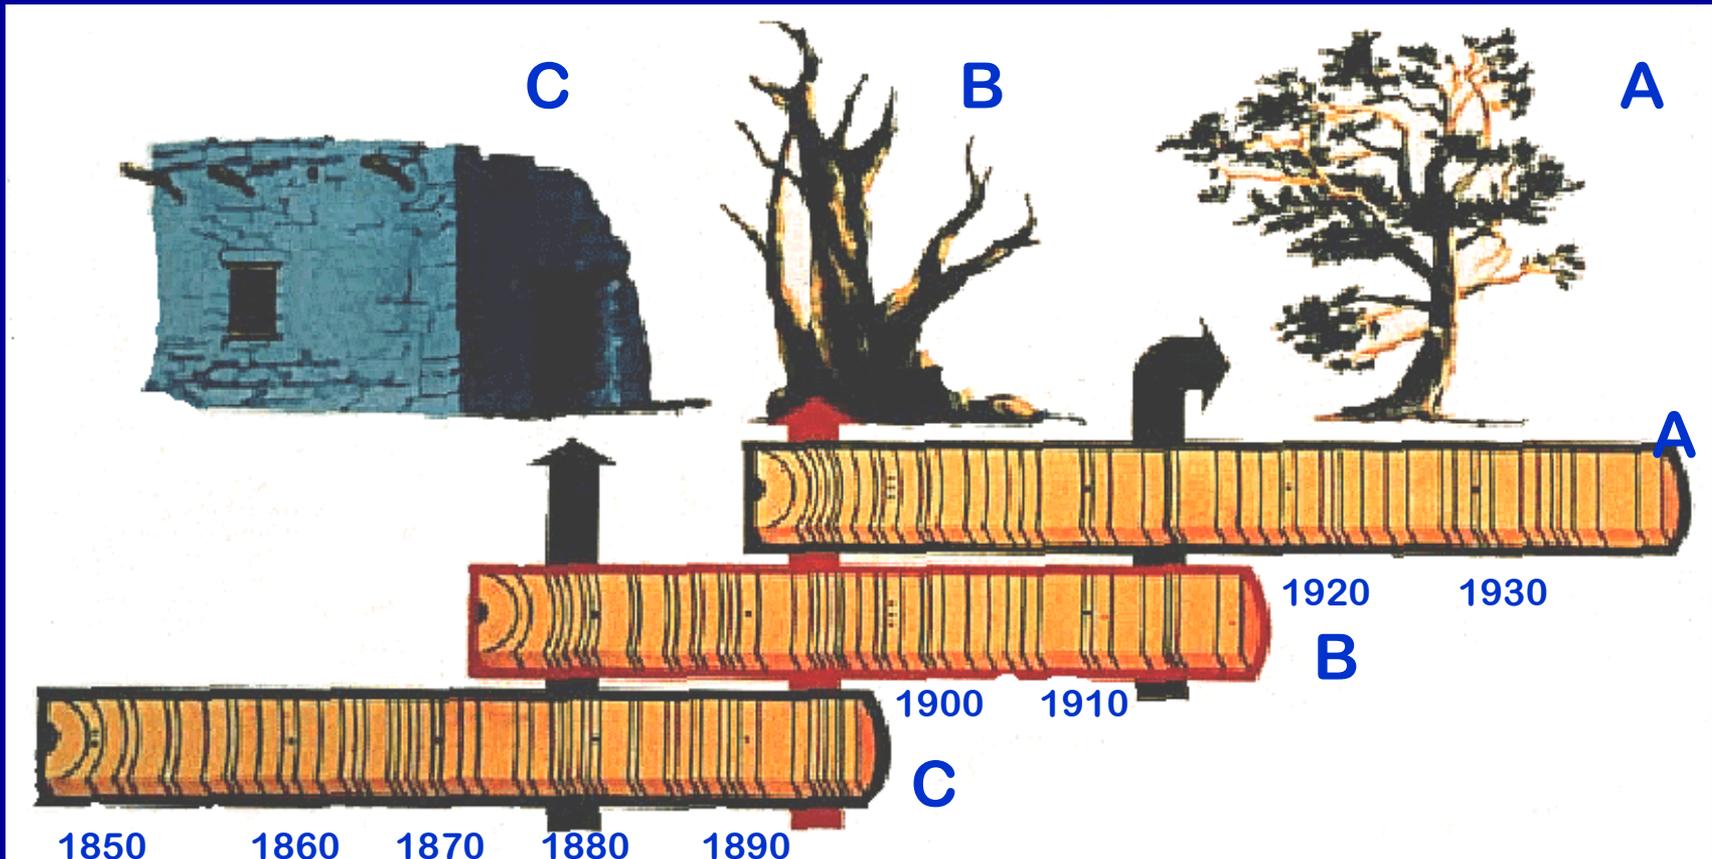

After crossdating, dendrochronologists can:

- **Assign the true year of formation for every ring of each sample**
- **Analyze past environmental and/or human events.**
- **Overlap crossdated samples (as above) to extend the record back in time:**

CROSSDATING: The Basic Principle of Dendrochronology

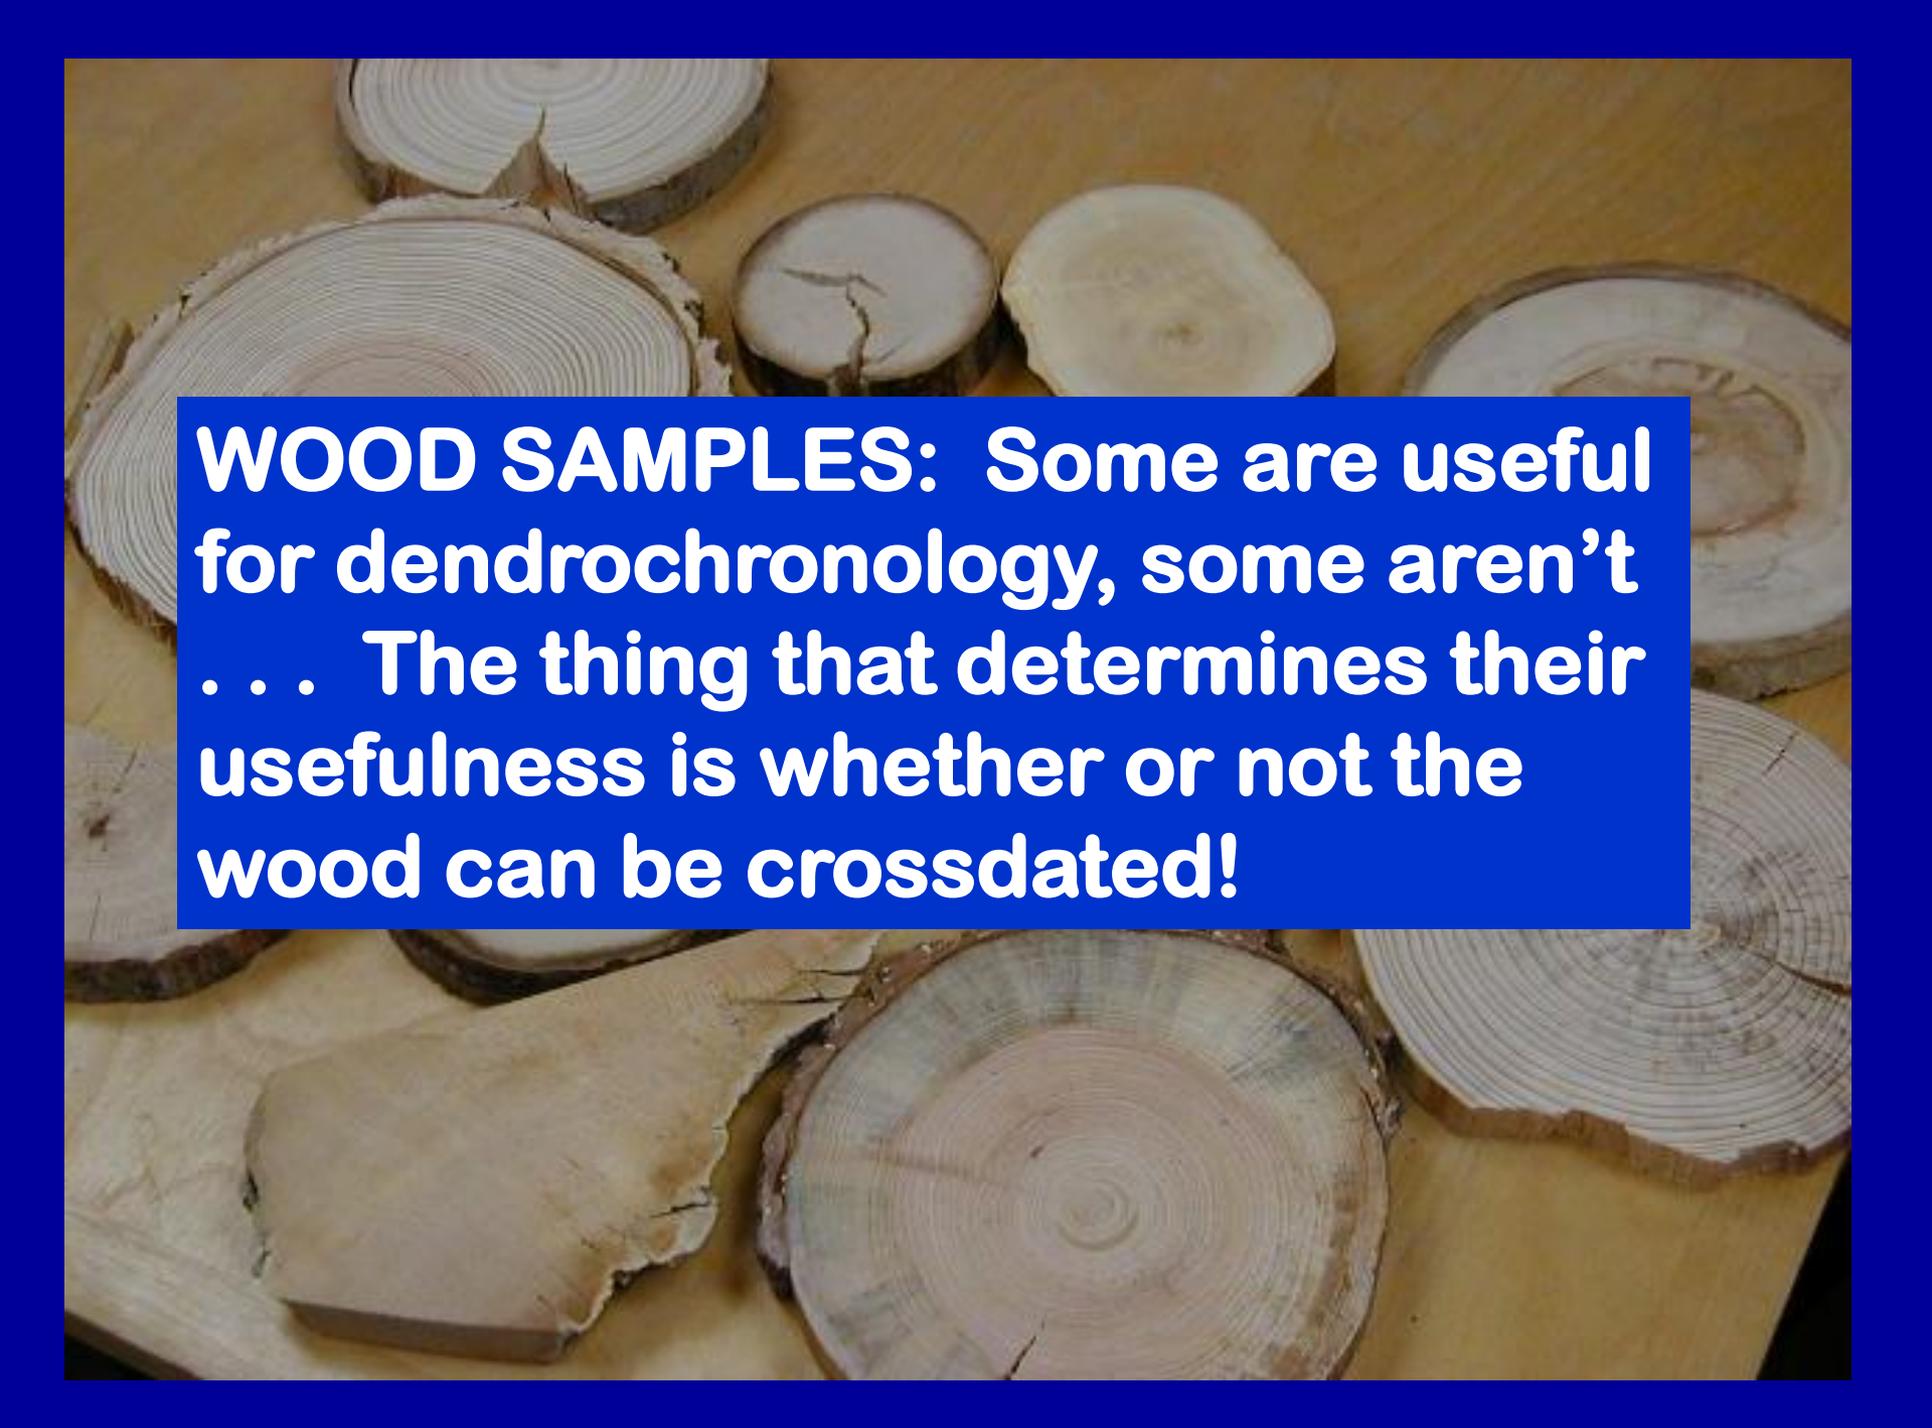

Calendar dates can be assigned throughout the record from known dates in the present, back in time!

NEXT: G - 3 “Wood Kits”

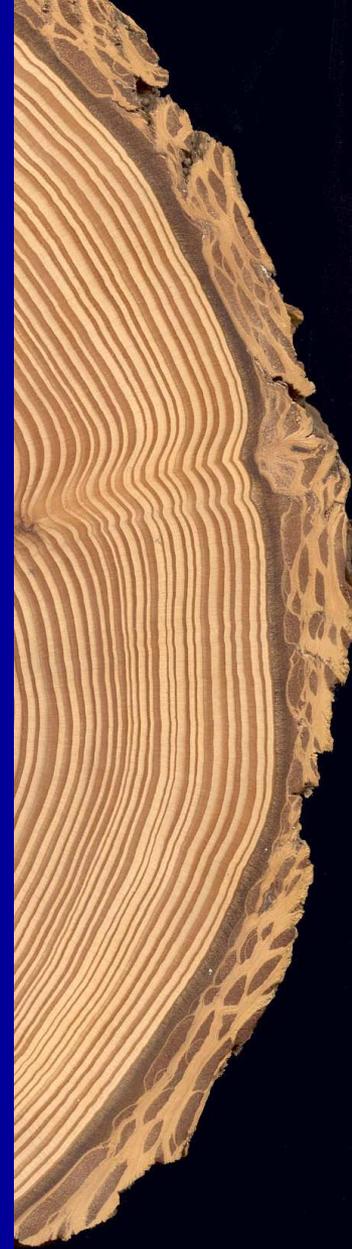

**Classifying Wood Samples from
Different Types of Trees to see if
they are good candidates for
CROSSDATING!**

The image shows several cross-sections of tree trunks of various sizes and species, laid out on a light-colored wooden surface. The wood grain is clearly visible, showing concentric growth rings. A blue rectangular box is overlaid on the center of the image, containing white text. The text explains that the usefulness of wood samples for dendrochronology depends on whether they can be crossdated.

WOOD SAMPLES: Some are useful for dendrochronology, some aren't ... The thing that determines their usefulness is whether or not the wood can be crossdated!

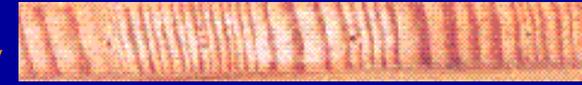

THE CHARACTERISTICS THAT MAKE A TREE SUITABLE FOR CROSSDATING :

- the tree has a **ring growth structure** (not all trees have rings!)
- the tree-ring **boundaries are distinct**
- the tree rings are **annual**, i.e., one ring is formed each calendar year
(hard to tell just by looking!)

THE CHARACTERISTICS THAT MAKE A TREE SUITABLE FOR CROSSDATING (cont.):

- the tree growth pattern is sensitive
not complacent

... so that variations from year-to-year ("interannual variations") show enough variations and distinct patterns that can be matched from core to core and tree to tree.

THE CHARACTERISTICS THAT MAKE A TREE SUITABLE FOR CROSSDATING (cont.):

the tree growth pattern has

"circuit uniformity"

i.e. the rings are continuous around the entire circumference of the tree

(so that the same ring pattern will appear if you core different sides of the tree.)

- the **length of tree-ring record is long enough** so that a valid pattern match can be made
(in general, a tree-ring record of 50 continuous rings or more is needed)

Goals of Assignment G-3:

(1) To see “inside” different species of trees and woody shrubs

(2) To classify the wood samples in a “wood kit” into categories :

Trees that are:

(1) Suitable or

(2) Unsuitable

. . . for crossdating and subsequent dendrochronological analysis.

When you complete **G-3**, you will
be ready for
INDIVIDUAL ASSIGNMENT I-2
which will be explained and
assigned after the Midterm Exam

But first, let's finish up the
G-2 Assignment!!
